

Prenatal Progesterone for Preventing Preterm Birth

This activity is jointly-provided by SynAptiv and the Colorado Hospital Association

Safe Deliveries Project Partnership

- Colorado Hospital Association
- Anthem Blue Cross and Blue Shield Foundation
- March of Dimes Colorado/Wyoming Chapter
- Colorado Perinatal Care Quality Collaborative

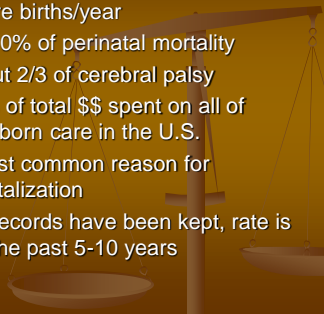

Thomas J. Garite, M.D.

- I have no conflicts of interest to disclose.

Impact of Prematurity

- 300,000 premature births/year
- Accounts for 60-70% of perinatal mortality
- Accounts for about 2/3 of cerebral palsy
- Accounts for 50% of total \$\$ spent on all of obstetric and newborn care in the U.S.
- Probably now most common reason for antepartum hospitalization
- No impact since records have been kept, rate is actually rising in the past 5-10 years

What does not work to prevent prematurity in at risk patients

Singletons

- Bed rest
- Prophylactic tocolytics
- Home uterine activity monitoring
- Baby ASA
- Antibiotics
- Risk Scoring and intensive antenatal surveillance

Twins

- Bed rest
- Cervical cerclage (routine)
- Multifetal reduction

Progesterone as an option for the prevention of prematurity

Endocrine Control of Parturition

- Uterine contractions
- Cervical ripening
- Rupture of membranes

Progesterone

- Critical in the activation of Estrogen to continue the cascade leading to labor is the reduction in the inhibitory effects of progesterone
- Unlike estrogen, the only apparent reason for the massive production of progesterone by the placenta is to inhibit the rapidly expanding uterus from going into labor prematurely
- Removal of progesterone in animals leads to the onset of labor

Physiologic Effects of Progesterone which allows labor inhibition

- Inhibits oxytocin activation of myometrium
- Directly inhibits prostaglandin production
- Decreases myometrial excitation
- Inhibition of gap junction formation

Prevention of Miscarriage with Progestins Meta-Analysis

14 Trials, total N = 1400
 MPA = medroxyprogesterone acetate, EL = Enol Luteovis
 Tognoni used 17P/allyloestradiol

■ Prevention of Recurrent Preterm Delivery by alpha 17 hydroxy Progesterone Caproate

Paul J. Meis, Mark Klebanoff, Elizabeth Thom, Mitchell Dombrowski, Baha Sabai, Atef Moawad, Catherine Spong, John Hauth, Menachem Miodovnik, Michael Warner, Kenneth Leveno, Steve Caritis, Jay Iams, Ronald Wapner, Deborah Conway, Mary J. O'Sullivan, Marshall Carpenter, Brian Mercer, Susan Ramin, John Thorp, Alan Peaceman for the National Institute of Child Health and Human Development Maternal-Fetal Medicine Units Network

Multicenter RCT of Progesterone

- All patients with h/o previous preterm delivery due to PTL or PPROM
- Randomized between 15 and 20 3/7 weeks
- Singletons only
- Given trial placebo injection
- Started on weekly IM 17alpha OH Progesterone Caproate or placebo (2:1 randomization) until 36 weeks.

Multi-center RCT of Progesterone

- Randomized 463 women (310 Prog., 153 Plac.)
- Preterm Delivery:
 - 36% Progesterone
 - 55% Placebo (P < 0.001)
- Delivery before 35 weeks
 - 21% Progesterone
 - 31% Placebo (P= 0.02)
- Delivery before 32 weeks
 - 11% Progesterone
 - 20% Placebo (P= 0.02)
- Borderline statistically significant reduction in neonatal death, ventilatory support, IVH, any O2 requirement

Fonseca et al: Prophylactic administration of progesterone by vaginal suppository to reduce the incidence of spontaneous preterm birth in women at increased risk: A randomized placebo-controlled double-blind trial:
Am J Obstet Gynecol 2003;18:

- Randomized patients with previous spont. preterm delivery, cerclage, uterine anomaly
- 100 mg progesterone suppositories or placebo every night from 24 to 34 weeks
- 142 patients randomize (70 Prog vs. 72 Plac.)

Effect of Vaginal Progesterone on Pregnancy Outcome in Singletons with an Ultrasonically Short Cervix (5 RCT's) An Individual Patient Meta-analysis

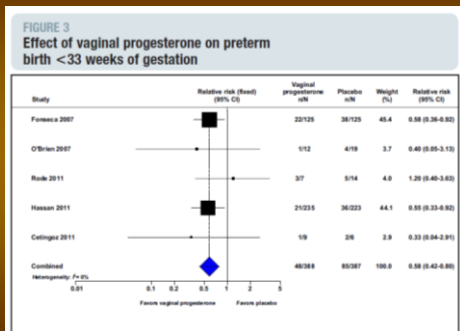

Romero et al: Am J Obstet Gynecol 2011;206(2) 124

Romero et al, AJOG 2012 Individual Patient Data Meta-analysis

- 5 trials, 775 women, 827 infants
- Vaginal progesterone treatment for TVU CL ≤ 25 mm (asymptomatic)
- 42% reduction in PTB < 33 weeks
- 43% reduction in composite neonatal morbidity and mortality
- 25% significant reduction in NICU admissions
- No significant differences between treatment and placebo groups in rates of adverse maternal events or congenital anomalies

Primary Outcome

42% reduction in the rate of preterm birth <33 weeks

Romero R, Nicolaides K, Conde-Agudelo A, Tabor A, O'Brien J, Cettingoz E, DA Fonseca E, Creasy G, Klein K, Rode L, Soma-Pillay P, Fusey S, Cam C, Alfirevic Z, Hassan S Am J Obstet Gynecol 2011;12:803

Need to Treat for Benefit

- Vaginal progesterone for short cervix
 - Treat 11 patients to prevent 1 PTB < 33 weeks
 - Treat 14 patients to prevent 1 case of RDS
- Magnesium sulfate for pre-eclampsia
 - Treat 100 patients to prevent 1 case of eclampsia
- Antenatal corticosteroids during preterm labor
 - Treat 13 patients to prevent 1 case of RDS

The Effect of Vaginal Progesterone on the Primary Outcome According to whether Patients had a Previous Preterm Birth

	Preterm birth before 33 weeks gestation		
	n	RR (95% CI)	Interaction p value
Obstetric history			0.68
With no previous preterm birth	606	0.61 (0.42-0.89)	
With ≥1 previous preterm birth	169	0.54 (0.30-0.98)	

Romero R, Nicolaides K, Conde-Agudelo A, Tabor A, O'Brien J, Cettingoz E, DA Fonseca E, Creasy G, Klein K, Rode L, Soma-Pillay P, Fussy S, Cam C, Alfirevic Z, Hassan S Am J Obstet Gynecol 2011;12:903

The Effect of Vaginal Progesterone on Composite Neonatal Morbidity/Mortality According to Whether Mothers had a Previous Preterm Birth

	Composite neonatal morbidity/mortality		
	n	RR (95% CI)	Interaction p value
Obstetric history			0.40
With no previous preterm birth	658	0.62 (0.43-0.91)	
With ≥1 previous preterm birth	169	0.41 (0.17-0.96)

Romero et al IPD Meta-analysis Progesterone for Women with Short Cervix

- Reduction in rates of spontaneous premature delivery at all gestational ages from < 28 to < 37 weeks.
- Impact greatest in preventing PTD at the very earliest gestational ages
- Impact in women with Cervical lengths < 10-25 mm, but only in subgroups 10-20mm
- Reduction seen in women with and without a history of previous preterm delivery
- No significant reduction in twins (underpowered/positive trend)

Vaginal Progesterone – The OPPTIMUM Study

Norman et al: Lancet on line Feb 23, 2016

- Multicenter RCT in UK of patients with either a short cervix (<25mm) or a previous PTB
- Randomized 1228 women daily 200mg vaginal P vs. placebo
- Outcome
 - Delivery < 34 weeks:
 - P 16.0% Placebo 18.1% (0.64-1.17)
 - Outcomes
 - NN Morbidity or Death: P 6.6%, Placebo 10.2% (0.38-1.03)
 - NN Death: P 0.01%, Placebo 1.0% (.06-.49)
 - Mod. to Severe Neurologic Impairment: P 12%, Placebo 9% (0.98-2.15)

Universal Cervical Length Screening? Cost-Benefit Analysis

Assumptions (based on Fonseca data)
 Singleton
 Prior PTB cases (7.3%) would get 17Pc if no TVCL
 One TVCL screen during anatomy scan, cost \$52
 TVCL < 15 mm in 1.2% of population
 Vaginal P4 will reduce PTB<34 weeks from 30% - 18%

Results (per 100,000 women screened)
 \$125 Million saved
 200 quality-adjusted life-years gained
 141 cases of serious neonatal morbidity prevented
 Universal screening better than screening targeted at women with prior PTB

Cahill et al, AJOG 202:548.e1-8, 2010

Universal Cervical Length Screening? Cost-Benefit Analysis

Assumptions (based on Fonseca data)
 Singleton
 No prior PTB
 Single TVCL screen at 18-24 weeks, cost \$187
 TVCL < 15 mm in 1.7% of population
 Vaginal P4 will reduce PTB<34 weeks from 32% to 17%

Results (per 100,000 women screened)
 \$12.1 Million saved
 434 quality-adjusted life-years gained
 22 neonatal deaths or neuro deficit prevented
 Robust across wide range of costs & assumptions

Werner et al., Ultrasound Ob Gyn 2011

Transabdominal Ultrasound

- Designed to image the baby
- Routine fetal anatomy scan at 18-22 weeks
 - Protocol includes looking at the cervix
 - Full bladder often elongates and distorts cervix
- Per ACOG/SMFM
 - Not reliable nor reproducible as a screening method
 - Not sufficient evidence to suggest benefit of TAU screening for progesterone or other intervention

Friedman et al: Can transabdominal ultrasound be used as a screening test for short cervical length? AJOG 2013 208 (3):190

- Screened 1217 Patients at 16-24 weeks with both TA and TV US
- 76 had a TV CL \leq 25 mm
- To have a 96% confidence of identifying these 76 women they needed to have a TA CL of \leq 36 mm
- 6.2% could not be screened due to technical difficulty
- 54% (657/1217) had a TA CL $<$ 36 mm
- **So with screening with TA US you will still need to do TV on 60% of women to identify almost all women who will have a TV CL of $<$ 25mm**

Transvaginal Ultrasound

- Designed to image the reproductive organs
 - Identify anomalies
 - Diagnose complications (e.g., cervical shortening, funneling, amniotic sludge or debris)
- Used in clinical trials of vaginal progesterone
- Per ACOG/SMFM
 - Diagnostic exam for intervention
 - Proper technique, quality control, monitoring essential
 - Certification recommended
- Perinatal Quality Foundation
 - 3 lectures
 - Exam
 - Image review
 - CME credit

The Arabin Pessary for the Prevention of PTB with a Short Cervix

Two Large RCT's of Pessary for a Short Cervix

- PECEP Study (Goya et al: Lancet 2012;379, 1800-06.
 - 385 women with CL < 25mm
 - Delivery < 34 weeks (primary outcome)
 - 6% pessary, 27% control (RR 0.24, 0.13-0.43)
 - Delivery < 28 weeks
 - 2% pessary, 8% control (RR 0.24, 0.09-0.73)
- Hui (Am J Perinat 2013 Apr;30(4):283-8
 - 108 women with CL < 25
 - Delivery < 34 weeks
 - 9% pessary, 6% control

RCT of Pessary in Twins

Liem et al: Lancet, 2013 382:1341

- RCT of all women with multiple pregnancy
- 40 Hospitals in the Netherlands
- 403 pessary, 410 control
- No overall difference in preterm birth or composite overall outcome
- In women with cervical length < 25th %
 - Composite nn morbidity - 12% pessary, 29% control (RR 0.42, (0.19-0.91)
 - PTD < 32 weeks - 12% pessary, 28% control (RR 0.43, 0.21-0.89)

Recent RCT of Pessary in Twins Nicolaides et al: AJOG 2016

- Randomized unselected twins to pessary at 20-24 weeks vs. routine care
 - N = 1180 (590 in each group)
- No differences in outcome
 - Delivery < 34 weeks – 13.6% vs. 12.9%
 - Adverse NN outcome – 10.0% vs. 9.2%
- Subanalysis of 214 women with a short cervix <25mm showed not benefit either

Bioteque Cup Pessary

Available in the U.S., Bioteque, Inc. San Jose, CA
FDA approved for use in pregnancy

Society Guidelines: Progesterone to Prevent Preterm Birth

SMFM

ACOG

ACNM

Recommendations for Routine Cervical Length Screening

- SMFM
 - The issue of universal TVU CL screening of singleton gestations without prior PTB for the prevention of PTB remains an object of debate. CL screening in singleton gestations without prior PTB cannot yet be universally mandated. Nonetheless, implementation of such a screening strategy can be viewed as reasonable, and can be considered by individual practitioners
- ACOG
 - Although this document does not mandate universal cervical length screening in women without a prior preterm birth, this screening strategy may be considered. Practitioners who decide to implement universal cervical length screening should follow one of the protocols for transvaginal measurement of cervical length from the clinical trials on this subject
- ACNM
 - Application of evidence based strategies to effectively screen women at potential risk for preterm birth should be accessible and available to every woman including strategies to assess cervical length in order to implement timely prevention strategies

SMFM CLINICAL GUIDELINE www.AJOG.org

Progesterone and preterm birth prevention: translating clinical trials data into clinical practice
Society for Maternal-Fetal Medicine Publications Committee, with the assistance of Vincenzo Berghella, MD

OBJECTIVE: We sought to provide evidence-based guidelines for using progesterone for the prevention of preterm birth (PTB).

METHODS: "Recent" guidelines, in particular randomized trials, were identified using PubMed U.S. National Library of Medicine, 1933 through February 2013 publications, written in English, which evaluate the effectiveness of progesterone for prevention of PTB. Progesterone evaluated were 17-alpha hydroxy progesterone and 17-alpha hydroxyprogesterone caproate. Additionally, the Cochrane Library, vaginal prostaglandin, and studies identified through review of the above were utilized to identify relevant articles. Data were evaluated according to population studied, with separate analyses for singleton vs multiple gestations, prior PTB, or short transvaginal ultrasound cervical length (CL), and combinations of these factors. Consistent with US Preventive Task Force suggestions, references were evaluated by quality based on the highest level of evidence, and recommendations were graded.

RESULTS AND RECOMMENDATIONS: Summary of evidence-based studies indicates that in women with singleton gestations, recurrent PTB, and short CL (≤ 20 mm at ≤ 24 weeks, vaginal progesterone, either 90 mg oral or 200 mg intravaginally, is associated with reduction in PTB and perinatal morbidity and mortality, and can be offered in these cases. The issue of universal CL screening of singleton gestations without prior PTB for the prevention of PTB remains an object of debate. CL screening in singleton gestations without prior PTB cannot yet be universally mandated. Nonetheless, implementation of such a screening strategy can be viewed as reasonable, and can be considered by individual practitioners. Following this guideline, in singleton gestations with prior PTB 20-36/37 weeks, 17-alpha-hydroxy progesterone caproate 250 mg intramuscularly weekly, preferably starting at 16-20 weeks and 36 weeks, is recommended. In those women with prior PTB, the transvaginal ultrasound CL, between ≤ 25 mm at ≤ 24 weeks, cervical cerclage may be offered. Progesterone has not been associated with prevention of PTB in women who have in the current pregnancy multiple gestations, preterm labor, or preterm premature rupture of membranes. There is insufficient evidence to recommend the use of progesterone in women with any of these risk factors, with or without a short CL.

Key words: 17-alpha hydroxy progesterone caproate, cervical length, preterm birth, prior preterm birth, progesterone, vaginal progesterone.

size of PTB, and to provide clinicians with current recommendations for their use in possible clinical scenarios. Other publications have not addressed the feasibility of this new information.⁴

As U7P and vaginal progesterone may not be their effect,⁵ they will be addressed separately. The effects of interventions on the reduction of PTB often vary by the population studied, and in particular by major risk factor categories for PTB. Major differences exist when assessing effects of other interventions by number of fetuses (ie, singleton vs multiple gestations), prior PTB (vs none), and short cervical length (CL) on transvaginal ultrasound (TVU) (vs none). These data will be analyzed according to these major categories of risk.

What are the mechanism of action and safety data of progesterone? Levels II and III

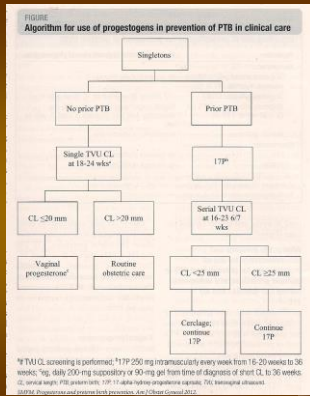

The mechanism of action and safety of progesterone are not the purpose of this review, and are discussed only briefly. While the exact mechanism of action of progesterone in preventing PTB is unknown, several possibilities have been proposed (Table 1).⁶⁻⁸ In general, the evidence seems to favor 2 mechanisms: an antiinflammatory effect that counter-

SMFM Recommendations

- In women with singletons, no prior ptb, <24 weeks with cervical length < 20 mm, vaginal progesterone 90 or 200 mg is associated with a reduction in PTB and PN morbidity and mortality and can be offered in these cases
- The issue of routine screening of all pregnant women is a subject of debate but such a screening strategy can be viewed as reasonable.....

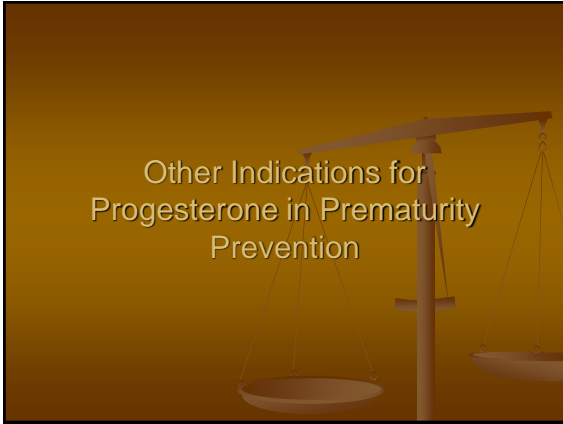

SMFM Recommendations (cont.)

- In singleton pregnancies with a prior (spontaneous) PTB prior to 37 weeks, 17 OH Prog caproate 250 mg IM q week starting at 16-20 weeks until 36 weeks is recommended
- In these women with a prior PTB and whom the cervix shortens to < 25 mm, cervical cerclage may (also) be offered.
- Progesterone has NOT been associated with a reduction in PTB in patients with multiple pregnancy, preterm labor or PPRM
- Transabdominal screening for cervical length is not recommended.

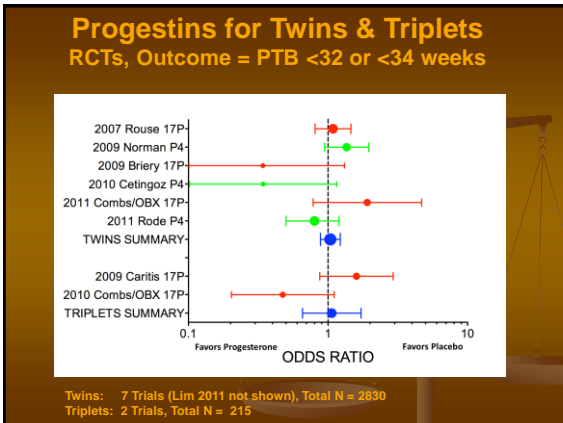

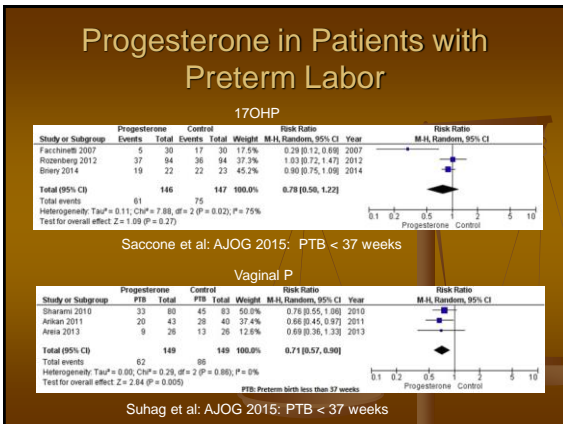

What are the concerns with routine endovaginal ultrasound screening?

- Lack of training and consistency in doing transvaginal US for cervical length
- "Indication Creep"
- What to do with 20-25 mm
- Lack of availability in some areas
- Applies to only about 2% of women
- Many ultrasounds for those needed to treat

Other Indications for Progesterone in Prematurity Prevention

Progesterone for PPROM
 RCT of patient with PPROM
 23 – 31 weeks
 17OHP Weekly vs. Placebo
 Combs, Garite et al: AJOG2015

Safety Issues

Perinatal Losses with Progestins
 (Miscarriages < 20 weeks, stillbirths, neonatal deaths)

11 placebo-controlled trials, Total N = 6166 offspring.
 3.5% Losses with Progesterin
 3.1% Losses with Placebo

Followup, Mean Age 48 months

From Meis 2003 Trial, history of prior PTB

Scores below Cut-off on Ages & Stages Questionnaire	17Pc (n=193)	Placebo (n=82)	P
Communication	11%	11%	NS

Problem-solving	10%	11%	NS
Diagnoses from Health Prof'l			
Motor skills problem	1%	1%	NS
Developmental delay	7%	8%	NS
Attention or learning problem	8%	10%	NS

Northen et al, Obstet Gynecol 110:865-72, 2007

Long Term Follow up of Babies from Progesterone Trials

- Rode et al (2011): US Ob Gyn: N = 433. Mean ASQ scores at 6 months and 18 months were **not significantly different** between the two groups (215 for infants in the progesterone group and 218 for infants in the placebo group at 6 months (P = 0.45) and 193 and 194, respectively, at 18 months (P = 0.89)).
- McNamara et al (2015): N=759 There was no evidence of difference between the progesterone and placebo groups in global health status assessed using the Health Utilities Index
- O'Brien et al (2011): N=229-445. Developmental f/u and morbid condition comparison at 6, 12 and 24 months, **no difference**
- Norman et al (2016): 869 **no difference**

Cognitive Composite score at 2 years, mean (SD)	97.7 (17.5) [†] n=439	97.3 (17.9) [†] n=430	0.48 (-2.77, 1.81)	0.680, p _{adj} =0.680
---	--------------------------------	--------------------------------	--------------------	--------------------------------

Progesterone Costs

- Makena (17OHP)
 - Retail \$680/dose, copay about \$70
 - Compounded – generally not available due to FDA bulletin
- Vaginal Progesterone
 - Crinone gel – about \$15/day
 - Prometrium – about \$1/day
 - Compounded Progesterone – cheap if available

Summary

- Progesterone lowers the rate of premature delivery and avoids many associated morbidities in:
 - Patients with a history of a prior PTB
 - Patients with a short cervix
 - In patients with a short cervix and a prior preterm birth both a cerclage and progesterone used together creates the optimum outcome
- Progesterone does not lower the rate of preterm birth in patients with multiple gestations
 - The jury is out on those with short Cervix
- Vaginal ultrasound for cervical length may become routine in all pregnant women
- Based on available data, progesterone is safe.
